

Hands-on Activity

Class 1s coming to Class 2

An enthusiastic set of two groups from class I came to our classes. They were all prepared to show and explain to us confidently, very interesting experiments.

1. The Colour Wheel

They started by explaining about various colors and where exactly those colors go once we start spinning the color wheel. Well! They are all there, it's just mixed together. The rapid spinning of the colour wheel causes the colour to blend into each other. This blending creates the illusion that they are actually white.

Children could confidently answer the questions put to them like –

- Is it magic?
- What happens when you spin the wheel slowly?
- So what is white colour made up of?

2. Mixing of Colours

When we mix two colours we get a new colour. The new colours were made by the children and the concept of primary colours and secondary colours was well explained.

It was really nice to see the little ones stand so confidently and explain every bit in great detail.
